

ASP.NET SOLUTION - 1

1. Write a program that uses a textbox for a user input name and validate it using RequiredFieldValidator Validation.

- **Design View:** Drag a Label (Text: "Enter Name"), a TextBox (ID: txtName), and a Button (ID: btnSave, Text: "Save").
- **Validator Setup:** Drag a RequiredFieldValidator from the Toolbox.
- **Property Configuration:**
 - **ControlToValidate:** txtName.
 - **ErrorMessage:** "Error: Name can't be empty!".
 - **ForeColor:** Red.
- **Execution:** The validator will prevent postback if the textbox is empty when "Save" is clicked.

2. Create the following Registration form with validation.

- **Form Fields:** Create a layout for Name, Address, Age, Gender (Male/Female), Email, Username, Password, and Confirm Password.
- **RequiredFieldValidator:** Apply to Name, Email, Username, and Passwords.
- **RangeValidator (Age):**
 - **MinimumValue:** 18.
 - **MaximumValue:** 25.
 - **ErrorMessage:** "Enter Age between 18 to 25 Years".
- **RegularExpressionValidator (Email):** Use the "Internet Email" expression to ensure a valid format.
- **CompareValidator (Confirm Password):**
 - **ControlToValidate:** txtConfirmPassword.
 - **ControlToCompare:** txtPassword.
 - **ErrorMessage:** "Password does not Match!".

3. Create the following file upload form and save .jpg photo in the 'img' folder.

- **Folder Creation:** Right-click your project in Solution Explorer, select Add > New Folder, and name it img.
- **Controls:** Drag a FileUpload control (ID: fuPhoto) and a Button (Text: "Upload").
- **Code-Behind (C#):**

```
C#
if (fuPhoto.HasFile) {
    string ext = System.IO.Path.GetExtension(fuPhoto.FileName).ToLower();
    if (ext == ".jpg") {
        fuPhoto.SaveAs(Server.MapPath("~/img/") + fuPhoto.FileName);
    }
}
```

4. Create a Database name 'Student'. Also create a table name "StudentDeetial" with the following fields.

- **Database:** In SQL Server, execute CREATE DATABASE Student;.
- **Table Schema:** Execute the following to create StudentDetail:
 - ID (Int).
 - SName (Varchar 50).
 - Address (Varchar 200).
 - Age (Int).
 - Gender (Varchar 6).
 - Email (Varchar 25).
 - Username (Varchar 15).
 - Password (Varchar 15).

5. Create database connection and save the Q.1 "User Registration" form detail in to the "StudentDetail" table.

- **Connection String:** Add your connection string to the Web.config file.

- **ADO.NET Logic:**

- Import using `System.Data.SqlClient;`
- Inside the Register button click, use `SqlConnection` and `SqlCommand`.
- Write an `INSERT INTO StudentDetail` query.
- Use `cmd.Parameters.AddWithValue()` to map textbox values to database fields.

6. **Create the following Registration form and store data in to the database. Also use validation.**

- **UI Components:** Build a form with First Name, Last Name, Email, Password, Re-type Password, Contact, and Gender.
- **Validation:** Add `RequiredFieldValidator` to all fields and a `CompareValidator` for the password.
- **Storage:** On the Submit click, open a SQL connection and execute the insert command to save the data.

7. **Create the following Feedback form and store data in to the database. Also use validation.**

- **Design:** Create fields for Name, Email, Subject, and Message.
- **Validation:** Ensure the Email field uses a `RegularExpressionValidator` and all fields are required.
- **Database:** Store the feedback entries into a specific Feedback table within your Student database.

8. Create the following Contact Us form and store data in to the database. Also use validation.

- **UI Sections:** Create a "Contact Us" header with "Email" and "Name" textboxes and a "Submit" button.
- **Footer Content:** Include static labels for "About Club", "Phone (Landline)", and "Our Office Location".
- **Functionality:** Implement SQL Insert logic to log these contacts into the database.

9. Create the following Contact Us form and store data in to the database. Also use validation.

- **Design:** Create a "Get in touch" card layout with textboxes for name, email, and a multi-line message box.
- **Validation:** Add validators for each input to ensure no field is submitted empty.
- **Backend:** Use ADO.NET to process the "Send" button and save the record to your database.
